Table 7. Ablation study. In the original Mamba model, the sequence output from the Mamba backbone is aggregated using simple mean pooling over the temporal dimension before being passed to a classification head. Mamba-Attention, which augments Mamba with a trainable attention mechanism in Euclidean space. Instead of uniform averaging, this attention module learns to assign varying importance to each time step, allowing the model to focus on the most informative regions of the sequence. It is important to note that this attention mechanism operates entirely in Euclidean space and differs from our GaA, which is tailored for the Riemannian manifold structure. We also define Geo-Mamba as the counterpart that incorporates *GeoMind*'s architectural improvements within Riemannian space, but without the GaA module. Our full proposed model, *GeoMind*, integrates both these enhancements along with the GaA module to fully leverage the underlying geometry of the data. Bold highlights the best performance.

Model	HCP-WM	ADNI	OASIS	PPMI	ABIDE
Mamba	96.76±0.86	$74.40{\pm}5.43$	$87.09 \pm 0.75$	$67.93 \pm 10.69$	66.34±0.27

Accuracy	97.22±0.63	$97.06 \pm 0.62$	$96.76 \pm 0.86$	$95.78 \pm 0.71$	$96.66 \pm 0.14$	98.29±0.26
Precision	97.27±0.62	$97.09 \pm 0.60$	$96.80 \pm 0.84$	$95.81 {\pm} 0.72$	$96.68 {\pm} 0.12$	98.18±0.34
F1-score	97.22±0.63	$97.06 \pm 0.62$	$96.76 \pm 0.86$	$95.78 \pm 0.72$	$96.66 \pm 0.14$	98.16±0.35

Table 10. Hyperparameter settings for different models. N denotes the number of brain regions. The code is available at anonymous GitHub for reproducibility. 'M-SGD' and 'M-Adam' represent Stochastic Gradient Descent (SGD) and Adam optimizers, respectively, equipped with manifold-aware updates that enforce geometric constraints (e.g., orthogonality).
